

Recent merging of ASAP3.0 to alma branch

...long and winding road...

Kana Sugimoto (ALMA Project, NAOJ)

Overview of the last merge

The last merge

•When?: 21 May - 9 Jun, 2010 ~ 3 weeks!!

Merged Revisions:

ATNF trunk ... release 3.0.0 alma branch ... 1752

Philosophy ... Implement as much as I can.

...but, its not easy.
I can NOT just simply "svn merge"... physical/effective collisions + modifications close in lines

We do many developments independently in both codes

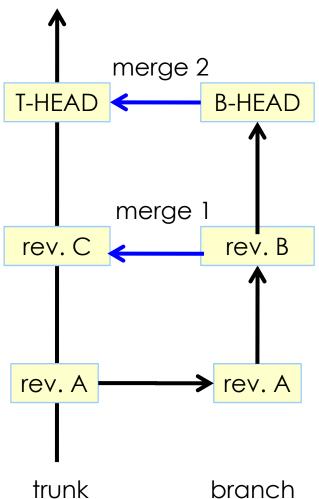

→ Needed to merge many codes manually... tough

svn merge

Apply the differences between two sources to a working copy path

merge 2:

merge developments between rev. B and HEAD of the branch. svn merge -r revB:HEAD http://path/to/the/branch at a working copy of T-HEAD

merge 1:

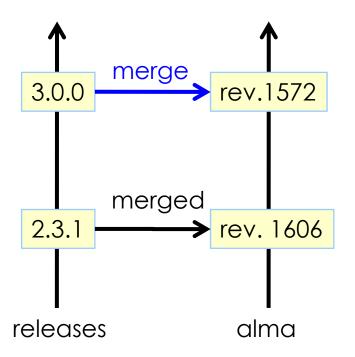

merge developments between rev. A and HEAD of the branch.

svn merge -r revA:HEAD http://path/to/branch at a working copy of T-HEAD

Merging strategy

Can I merge developments between ASAP 2.3.1 and 3.0.0 to the HEAD of alma branch by simply "svn merge"?

Unfortunately NOT!!

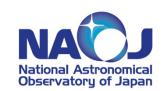

There are many collisions both physically and effectively.

I only have to put my eyes on python/, src/, and external/!

```
[kana@casadev1 alma-merged300]$ ls
admin/
         doc/
                     qetsvnrev.sh*
                                     plugins/
                                                               web/
                                                  share/
         Doxyfile
                                     python/
apps/
                     INSTALL
                                                  src/
bin/
         examples/
                     Makefile
                                     scons/
                                                  test/
COPYING (external)
                     monitor/
                                     SConstruct
                                                  tutorials/
```

A snapshot. Effective codes are in CASA

The other things to keep in mind

There are some other differences between CASA-ASAP and ATNF-ASAP:

1. Build system

alma: (g)make with Makefiles

ATNF: scons

2. Versions of third party packages

python: 2.5.2 (alma) will be updated to 2.6 for the next

release

matplotlib: 0.91.4 (alma) while ATNF assumes >=0.98

casacore: implements developments by CASA group

3. CASA-ASAP is based on CASA codes

CASA logger, filler codes (libatnf)

Actual steps

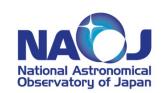

- "merge" developments between ASAP 2.3.1→ 3.0.0 to codes in alma branch except for python/, src/, and external/.
- 2. <u>merge or apply patches for codes in python/, src/, and external/ if it's possible, i.e., no collision.</u>

Added: 11 (python 5, src 6)

Modified: 63 (python 12, src 25, external 26)... most of them are modified in both branch

- 3. <u>implement developments by hand for codes which don't accept patches (27/63)</u>
- 4. update Makefiles (if necessary)
- 5. update CASA codes calling ASAP functions (if necessary)
- 6. build tests, bug fixes, regression tests, and finally... commit!!

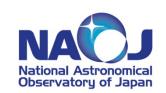

Things not implemented to alma

- printing logs by the decorator function, @print_log_dec.
 in asapfitter.py, asapmath.py, asapplotter.py, asapreader.py, and
 scantable.py (commented out)
 - → unify log system or wrap the difference?
- plot functions using new features of Matplotlib > 0.91. get_region & get_point in asaplotbase.py, keyword interactive not accepted for axes funcs in asapplotter.py
 → Matplotlib in CASA is planed to be updated in CASA 3.2.
- 3. Translation of SRCTYPE in STWriter ... CASA-ASAP understands more source types defined in PSKIO/SrcType.h.
- several files in external/atnf is not implemted to CASA-ASAP (PKSmsg & pksmb_support)
- bit more differences in plotter fontsize definition (@asaplotbase), scantable parameter remains in plotazel & plotpointing (@asapplotter)

Summaries and for Future... (1/2)

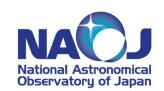

The ATNF-ASAP 3.0.0 developments are implemented to ALMA branch (rev.1757)... good!

But it required manual merging by hand for codes in python/, src/, and external/ ... too bad!!

This happens because...

- 1. we develop independently w/o communications
 - → requires resolution of collisions by hand
- 2. long time passed since we branched and many have been changed in both codes
 - → disables merging by applying patches

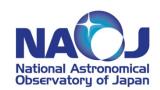

Summaries and for Future... (2/2)

So what shall we do? ... 2 extremes + an idea in between

- never merge again ... easy
- unify repository ... need arrangement + developments (logger, build system, ...what else?)
- more communications + more frequent merge to each other

Any other ideas?

授 Thanks
